Anipro®

For Sheep Production

When producing top quality meat and wool products for domestic and export markets, you can't just rely on good seasonal conditions. You need to make the most of what you have - whether its fresh or mature forage.

Throughout Australia, paddock forage provides a large proportion of the feed available to livestock. For the majority of the year though, forage is high in fibre and low in protein, and is unlikely to meet the total nutritional requirements of sheep - particularly during late gestation, lactation and periods of high stress and/or growth.

Supplementation Made Easy

Anipro - the recognised leader in liquid supplementation for grazing livestock - helps maximise return from pasture and crop-based production systems as well as grain fed animals.

Known for its high quality individual programs, superior service, integrity and professionalism, Anipro for Sheep Production can help boost a producer's ability to consistently meet stringent market demands for product specifications.

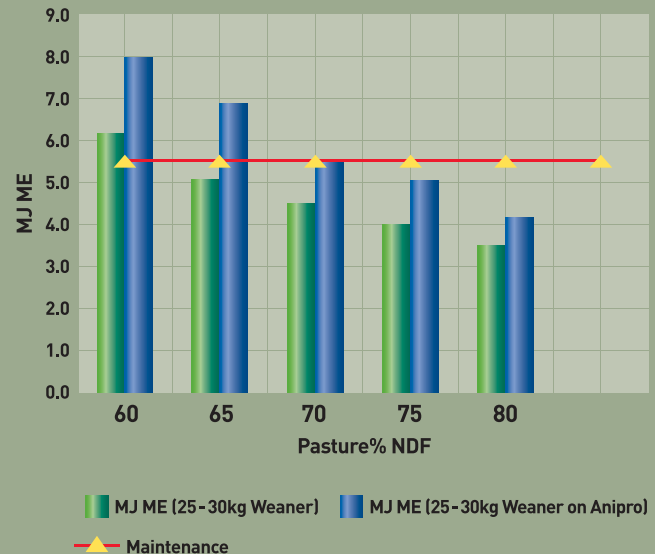

Anipro for Sheep Production is a molasses based, two - part, "sweet" and "sour" protein supplement.

Anipro is formulated to balance the dietary nutrients for sheep grazing pasture, forage crops and hay as well as lot-fed animals.

By providing essential nutrients including: natural, plant derived protein; **RumaPro**[®], a safe form of nonprotein nitrogen and minerals and vitamins, Anipro Supplements help to maintain consistent growth paths, minimise weight loss and improve meat, milk and wool production, driving an animal's production to its full potential.

Anipro allows Extra Energy from Pasture & Forages

Anipro means 'Maximum Production Potential'

Anipro helps your sheep eat more dry matter, and digest it more easily. A balanced combination of essential nutrients makes more available from whatever they eat - leading to better growth, breeding success and improved meat and wool production. Plus, a palatable molasses-based formula, suitable for all classes of sheep, promotes a widespread and consistent intake, making sure your animals get the dose they need.

Key Factors

- Improves intake and digestion of pasture feed
- Balances the nutrient profile of any forage (fresh or dry)
- Improves feed conversion efficiency of grain raised sheep
- Enhances then maintains animal's vitamin and mineral status

Anipro means 'Service'

Service has always been a big part of the Anipro approach. Trained Anipro specialists know exactly which Anipro program is best for your animals. They work out intake targets based on available forage and status of the flock. They regulate consumption to make sure your animals get the supplemental nutrient they need. Costs such as labour, delivery and even the troughs are all included as part of an Anipro fully serviced program.

Key Factors

- Professional, trained service specialists
- No capital or labour costs
- Consumption adjusted to animal and production requirements

The RumaPro® Advantage.

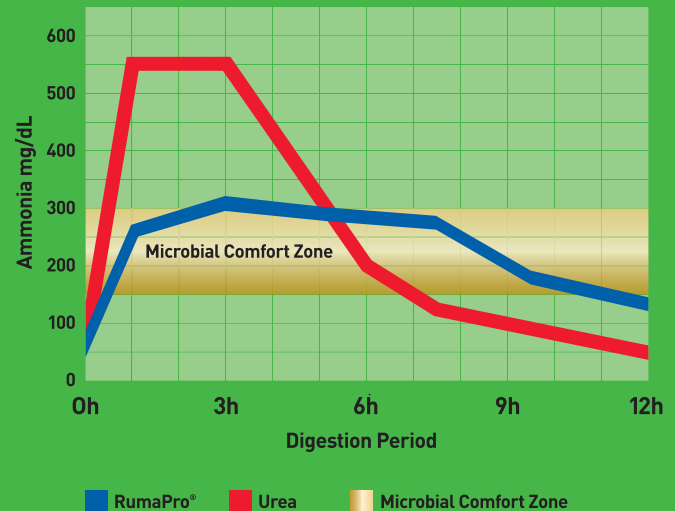

What an animal eats is important, but what happens once inside is even more so.

In livestock, micro-organisms in the rumen ferment plant tissue and provide a major source of protein for the animal. To do this, they need nitrogen - and they get this from ammonia in the rumen fluid.

All Anipro Supplements contain **RumaPro®** - a unique, non-protein nitrogen (NPN) ingredient specifically developed to provide a sustained release ammonia source for ruminants.

RumaPro®, coupled with natural plant protein, is the ideal urea/protein combination for sheep; delivering a sustained level of NPN and effectively reducing the risk of urea toxicity associated with other protein supplements.

RumaPro® - A True Sustained Release NPN Source

Anipro means 'Quality'

Anipro for Sheep has been developed using the best manufacturing processes and ingredients, all in accordance with National Research Council (NRC) guidelines, ensuring accurate supply of required nutrients - protein, essential minerals and vitamins.

And as an added bonus, Anipro Supplements contain; **ABSORB**, a metal specific amino acid complex, and extra vitamin E which research shows, promotes meat quality, fertility, colostrum quality, milk yield, and lamb survivability.

Key Factors

- Premium quality ingredients
- Balanced, effective nutrient provision
- Produced to stringent QA standards.

ABSORB® is a Registered Trademark of Optimum Animal Efficiency Pty Ltd

Target Anipro Intake Rates for various Sheep Classes:

Category	Live Weight (kg)	mL/hd/d
Weaners	25 - 35	40
Hoggets	40 - 50	55
Ewes (dry)	60	75
Ewes (lactating)	65 - 70	80
Wethers	55	70
Rams	70+	85

Anipro intakes are based on an application rate of 12.5 mL per 10 kg live weight:

- Minimum effective intake (e.g. for weaners) is 40 mL.
- When supplementing lactating cows, the weight of the lamb is included.

For maximum response and value, Anipro supplementation should be implemented:

- In conjunction with sound animal health and husbandry procedures
- In accordance with an animal's nutritional requirements and dietary inputs from pasture and other forages
- Under the Performance Feeds "Product Application Protocol"

For maximised production, incorporate Anipro into a Performance Feeds TimeWise Nutrition program.
